the single polymer of vinyl monomer or copolymer of at least two mol. cpd. of A hologram recording material includes the combination of (A) high

cpd. (A) has the crosslinkable (meth)acryloyl gp. The difference of . Lom Apid bond, (C) cyanine dye and (D) sulphonium organic boron complex. unsaturated monomers, (B) the cpd. having at least one polymerisable ethylene Vinyl

refractive index of the high mol. cpd. of (A) and that of the cpd. гре

(B) is not

less than 0.005.

comprises exposing the recording material, and then applying the The manufacturing of the hologram by using the hologram recording

light and/or

neat to the same.

introducing the vinyl monomer having a functional gp. such as Pref. the high mol. cpd. having crosslinkable (meth) acryloyl gp., is

hydroxyl gp.,

polymer of carboxyl gp., phosphoric gp., chloromethyl gp. or epoxy gp., to the

the vinyl monomer.

USE/ADVANTAGE - The vol. phase-type hologram having high sensitivity

the wide wavelength area, and chemically stabilised, can be obtd. The cykondyone

of high definition, high refractive index and high transparency can ротодкат

pe easily

DETAILED DESCRIPTION

Irocol [noitnevnl edt to noitqripsed belisted]

in the large wavelength area, and were excellent in resolution, diffraction efficiency, and chemical stability or an environmental capability-proof, and had a high sensitivity characteristic phase type hologram using the hologram recording material and it which were excellent in [industrial Application] This invention relates to the manufacturing method of a simple volume

transparency.

resolution or an environmental capability-proof, for example, moisture resistance, and complicated wet-developing processing, and it had the problem of being further inferior to of hologram recording material. However, both the hologram materials using this needed bleaching processing silver salt and a dichromated gelatin system have been used as a charge Description of the Prior Art]Conventionally, generally the photosensitive materials of a [0000]

white blush mark, arise. Since the polymer used was non-cross-linking, there was a fault of to the sensitivity characteristic in a long wavelength field, and a fall of the transparency by a and the opening produced at the time of solvent immersion operation, or a crack or it is inferior complicated nature of having adopted the wet process process in manufacture of a hologram problems, such as development unevenness which originates in the manufacturing diffraction efficiency, resolution, and an environmental capability-proof, but. It had a fault, like known art concerned is followed, can manufacture the hologram outstanding in points, such as bonds, the polymer of non-cross-linking, and combination with an initiator is indicated. If the characterized by the polytunctional monomer which has two or more ethylenic unsaturated should be solved. For example, in JP,62-22152,B, the hologram recording material [0003] The hologram recording material using a photopolymer is proposed that such a problem weatherability.

a fault, like control of thickness is difficult.

being inferior to the intensity of a hardening layer. [0004]The hologram recording material (and) using the photopolymer which can manufacture a hologram only by interference exposure on the other hand as only down stream processing which does not need a complicated or complicated wet process process in the manufacturing process of a hologram, or its manufacturing method is indicated. For example, in JP,2-3081,A or JP,2-3082,A, The photopolymerization nature constituent for hologram recording and the element for refractive-index pictures which comprise themoplastic polymer having a substituent in which either polymer or a monomer contains an aromatic ring or a halogen atom, a fluid ethylenic monomer, and a photoinitiator are indicated. That the hologram excellent in high diffraction efficiency, high resolution, an environmental capability-proof, and transparency will be manufactured if this known at is followed, SPIE "Practical Holography IV", the 1212nd wolume, 30 pages (1991) and "Journal of ImagingScience", the 35th volume, 19 pages, and 25 pages (1991) prove. However, the sensitivity characteristic in the long wavelength field of this pages (1991) prove. However, the sensitivity characteristic in the long wavelength field of this

hologram recording material is a several 100 mJ/cm² order. In order to shorten exposure time in the duplicate of a hologram, to raise a sensitivity characteristic further was desired.

[0005]In JP,2-51188,A, the constituent for holograms which becomes the intramolecular which has a difference in a refractive index from the plurality of a compound which has one or more polymentzation nature carbon-carbon double bonds is indicated. If this known art is followed, the high resolution and the hologram of high diffraction efficiency which do not need complicated down stream processing will be manufactured, but. Since urethane acrylate with a low glass transition temperature was used for intramolecular as one of the compounds which inferior in the heat resistance characteristics of a hologram.

[0006]In JP,3-36582,A and JP,3-249785,A, the hologram recording material combining the allyl monomer a refractive index and whose polymerization nature are different, and an acrylic monomer is indicated. If this known art is followed, it is proved by the "Holographic Display wolume phase type hologram of high diffraction efficiency can be manufactured. However, in volume phase type hologram of high diffraction efficiency can be manufactured. However, in this known art, since the monomer which has mobility was used as the main ingredients,

[Problem(s) to be Solved by the Invention] This invention is providing the simple manufacturing method of a volume phase type hologram using a hologram recording material and it with the

exposure, needed to be performed beforehand, and operation became complicated and it had

processing for controlling the mobility of a film, such as heat-treating before hologram

http://www4.ipdl.inpit.go.jp/cgi-bin/tran_web_cgi_ejje?atw_u=http%3A%2F%2Fwww4.ip... 6/19/2009

characteristic which was excellent in the environmental capability-proof, and was excellent in high sensitivity and resolution, diffraction efficiency, and transparency in the large wavelength

sues.

[Means for Solving the Problem]This invention persons result in this invention, as a result of inquiring wholeheartedly in consideration of the above many points that the above-mentioned

hologram applying light and (or) heat. this hologram recording material, it is a manufacturing method of a volume phase type using a hologram recording material of a statement, After carrying out hologram exposure of sulfonium organicity boron complex (D) or thru/or the third invention -- in creating a hologram which can polymerize, either the first invention including combination of cyanine dye (C) and a ingredients, A compound (B) which has at least one or more ethylenic unsaturated bonds homopolymer of a vinyl monomer, or a copolymer of a vinyl monomer of two or more polymerize is 0.005 or more. A high molecular compound (A) whose fourth invention is a compound (B) which has at least one or more ethylenic unsaturated bonds which can given in the first invention, wherein refractive index difference with a refractive index of a copolymer of a vinyl monomer of two or more ingredients, It is a hologram recording material molecular compound (A) whose third invention is a homopolymer of a vinyl monomer, or a having an acrylyl group (meta) which can construct a bridge. A refractive index of a high monomer or a copolymer of a vinyl monomer of two or more ingredients is characterized by the first invention for which a high molecular compound (A) which is a homopolymer of a vinyl organicity boron complex (D). The second invention is a hologram recording material given in at least one or more ethylenic unsaturated bonds which can polymerize, and a sulfonium recording material including combination of a compound (B) and cyanine dye (C) which have vinyl monomer, or a copolymer of a vinyl monomer of two or more ingredients, It is a hologram [0009] Namely, a high molecular compound (A) whose first invention is a homopolymer of a purpose should be attained.

[0010] Hereafter, this invention is explained extensively.
[0011] First, a high molecular compound (A) which is a homopolymer of a vinyl monomer or a copolymer of a vinyl monomer of two or more ingredients used by this invention is illustrated. As a polymer of such a vinyl monomer, methyl, ethyl, propyl, loopropyl, n-butyl, sec-butyl, tertbutyl, pentyl, Meopentyl one, hexyl, heptyl, octyl, nonyl, dodecyl, 2-methylbutyl, 3-methylbutyl, 2-ethylbutyl, 1,3-dimethylbutyl, 2-ethylhexyl, 2-methylpentyl, cyclohexyl, adamanthyl, Chains, auch as isobornyl, dicyclopentanil, and tetrahydrofurfuryl, A letter of branching, and a polymer of acrylic ester monomer (meta) of annular alkyl, 2-hydroxyethyl, 2-hydroxypropyl, 4-hydroxybutyl, A polymer of acrylic ester monomer which has hydroxyethyl, 2-hydroxypropyl, and 2-(meta) acryloxyethyl 2'-hydroxypropyl phthalate (meta), 2-hydroxy-3-phenoxypropyl, and 2-(meta) acryloxyethyl 2'-hydroxypropyl phthalate (meta), 2-hydroxypropyl phthalate (meta),

more ingredients are mentioned. vinylpyrrolidine, vinylbutyral, and a vinyl acetal, is mentioned, and these copolymers of two or polymer of vinyl monomers, such as N-vinyl pyrrolidone, N-vinylcarbazole, vinylpyridine, styrene, Alpha-methylstyrene, vinyltoluene, vinyl acetate, VCM/PVC, a vinylidene chloride, A hydroxystyrene, 4-hydroxymethylstyrene, 4-bromostyrene, chloromethyl styrene, perfluoro Acrylamide, N-butylacrylamide, N,N-dimethylacrylamide, Acrylonitrile, styrene, 4ester monomer, such as ethyleneoxide denaturation phosphoric acid (meta) acrylate, acryloyloxypropyl hexahydrophthalic acid, A polymer of phosphate group content (meta) acrylic carboxyl groups, such as 2-(meta) acryloyloxypropyl tetrahydrophtal acid and 2-(meta) acid, 2-(meta) acryloyloxypropyl phthalic acid, A polymer of a vinyl monomer containing vinylbenzoic acid, 2-(meta) acryloyloxyethyl succinic acid, 2-(meta) acryloyloxyethyl phthalic N,N-diethylaminoethyl, and t-butylamino ethyl, (Meta) Acrylic acid, itaconic acid, maleic acid, pacrylic ester monomer (meta) containing amino groups, such as N,N-dimethylaminoethyl, a acrylic ester (meta) containing alkoxysilane groups, such as trimethoxysilylpropyl, A polymer of containing halogen atoms, such as octafluoropentyl and 2,3-dibromopropyl, A polymer of Trifluoroethyl, tetrafluoro propyl, heptadecafluorodecyl, A polymer of acrylic ester (meta) (meta) containing iron atoms, such as ferrocenyl-methyl group and ferrocenyl-ethyl group, containing epoxy groups, such as glycidyl (meta) acrylate, A polymer of acrylic ester monomer phenoxyhexaethylene glycol and 4-biphenylyl, A polymer of acrylic ester monomer (meta) glycol, A polymer of acrylic ester monomer (meta) containing aromatic rings, such as 4buthylphenyl, benzyl, 4-phenylethyl, 4-phenoxydiethylene glucohol, 4-phenoxytetraethylene Phenyl, 4-methoxy carbonylphenyl, 4-ethoxycarbonylphenyl, 4-butoxycarbonylphenyl, 4-tert-

[0012]Next, as a high molecular compound which has an acrylyl group (meta) which can construct a bridge with a homopolymer of a vinyl monomer or a copolymer of a vinyl monomer of two or more ingredients used in this invention, It is obtained by introducing an acrylyl group (meta) into a high molecular compound which contains as a unit a vinyl monomer which has functional groups, such as a hydroxyl group, a carboxyl group, a phosphate group, a carboxyl group, a phosphate group, a carboxyl group a carboxyl group.

SAIENTIFIKU (1977). [0013]As a compound (B) which has at least one or more polymerization nature ethylenic unsaturated bonds of use by this invention, oligomer other than monofunctional or a polyfunctional vinyl monomer may be included, and it may be the amount compound of polymers further. Next, these compounds are illustrated. [0014](Meta) Unsaturation acid compounds, such as acrylic acid, itaconic acid, and maleic

(meta) acrylate, ferrocenyl-ethyl group (meta) acrylate, and zinc di(meth)acrylate, etc. are (meta) acrylate compounds, such as acrylic-ized EPOSHIKI resin, ferrocenyl-methyl group (PUROPI) RENOKISHIDO denaturation di(meth)acrylate, (Meta) Heavy metal atom content (PUROPI) RENOKISHIDO denaturation (meta) acrylate of isocyanuric acid, Bisphenol A ECHI resorcinol, It or poly (meta) acrylate compounds, such as catechol and pyrogallol, ECHI (meth)acrylate (meta), An aromatic polyhydroxy compound, for example, hydroquinone, compound containing aromatic rings, such as phthalic acid epichlorohydrin denaturation di phenoxyhexaethylene glycol (meta) acrylate, 4-biphenylyl (meta) acrylate, An acrylate glucohol (meta) acrylate, 4-phenoxytetraethylene glycol (meta) acrylate, 4acrylate, 4-phenoxyethyl (meta) acrylate, 4-phenylethyl (meta) acrylate, 4-phenoxydiethylene butoxycarbonylphenyl (meta) acrylate, 4-tert-buthylphenyl (meta) acrylate, benzyl (meta) methoxy carbonylphenyl (meta) acrylate, 4-ethoxycarbonylphenyl (meta) acrylate, 4-ECHI (PUROPI) RENOKISHIDO denaturation di(meth)acrylate, Phenyl (meta) acrylate, 4compounds, such as p-bromophenoxyethyl (meta) AKURETO and tetrabromobisphenol A FEMORUTORI ethylene oxide (meta) acrylate, Bromine atom content (meta) acrylate acrylate and heptadecafluorodecyl (meta) acrylate, 2,3-dibromopropyl (meta) acrylate, tribromo acrylate, Fluorine atom content (meta) acrylate compounds, such as octafluoropentyl (meta) trifluoroethyl (meta) acrylate, Tetrafluoro propyl (meta) acrylate, hexafluoro propyl (meta) dipentaerythritol, neopentyl glycol, sorbitol, Jl, such as mannitol, or poly (meta) acrylic ester, pentanediol, 1,6-hexanediol, 1,10-Deccan diol, trimethylolpropane, pentaerythritol, Triethylene glycol, tetraethylene glycol, neopentyl glycol, 1,3-propanediol, 1,4-butanediol, 1,5aliphatic series polyhydroxy compound, for example, ethylene glycol, a diethylene glycol, (meta-) acrylamide, 2-hydroxyethyl (meta-) acrylate, and N-vinylcarbazole, -- further, An Morpholino ethyl (meta) acrylate, acrylamide (meta), vinyl monomers, such as diacetone acrylate, glycidyl (meta) acrylate, Allyl (meta) acrylate, dimethylaminoethyl (meta) acrylate, alkyl-ester (meta) compounds, such as isobornyl (meta) acrylate, Tetrahydro furil (meta) acid, Methyl (meta) acrylate, ethyl (meta) acrylate, cyclohexyl (meta) acrylate, Acrylic-acid-

mentioned. I00157Cvanine dve (C) of use by this invention is a general formula (1).

[0015]Cyanine dye (C) of use by this invention is a general formula (1).

(f) slumnof lenena-[6f00]

[0017]inside [of a formula (1)], Y, and Y' -- respectively -- independent -- an oxygen atom and

a sulfur atom. Express a selenium atom, an NH group, a CH=CH basis, or $C(CH_3)$ 2 set, and n is shown, and integers, such as 0, 1, or 2, \mathbb{R}^1 and \mathbb{R}^2 , Mutually, an alkyl group, a substituted

is shown, and integers, such as 0, 1, or 2, R^1 and R^2 , Mutually, an alkyl group, a substituted alkyl group, an aryl group, an aryl group, or an alkenyl group is shown, and it may be the same, or may differ, and X, Halogen, MO_3 , BF_4 , PF_6 , AsF_6 , CIO_4 , SbF_6 , CF_3SO_3 , or $CH_3C_6H_4SO_3$ is shown. The cyanine dye (C) expressed is

(1971) I in accordance with a method of a statement, and can also obtain from Japanese Chemistry of Synthetic Dyes[edited by KVenkataraman]", It can compound [211-340 pages [0019]Cyanine dye expressed with such a general formula (1), G.E. Ficken, volume [4th] "The propenyl group, 2-butenyl group, 3-butenyl group, an isopropenyl group, etc. shape to 2 thru/or 4, or a letter of branching, and can mention a vinyl group, an allyl group, 1group, etc., As an alkenyl group, a carbon number can express an alkenyl group of linear fluorophenyl group, p-chlorophenyl group, p-dimethylaminophenyl group, p-phenylthiophenyl phenan tolyl group, p-cyanophenyl group, a 2,4-bis(trifluoromethyl)phenyl group, pp-methoxypheny group, a biphenylyl group, a naphthyl group, an anthryl group, They are a substituent, A phenyl group, p-tolyl group, a xylyl group, a mesityl group, a KUMENIRU group, group, a hydroxymethyl group, a menthyl group, the Pina Nils group, etc., and may have a trichloromethyl group, As an aryl group which are a methoxymethyl group, a carboxymethyl carbonylmethyl group, A chloromethyl group, a bromomethyl group, a trifluoromethyl group, a chloromethyl group, a bromomethyl group, a methoxy carbonylmethyl group, an ethoxy An acetonyl group, a phenacyl group, a salicyl group, an anisyl group, a cyanomethyl group, A octadecył group, A stearyl group, a cyclohexyl group, a menthyl group, a bornyl group, benzyl, butyl group, A pentyl group, a hexyl group, an octyl group, a decyl group, dodecyl, an have a substituent, A methyl group, an ethyl group, n-butyl group, a sec-butyl group, a tert-[0018]Next, it a substituent in a general formula (1) is explained, as an alkyl group which may mentioned.

Sensitizing dye research institute. [0020]As an example of representation of cyanine dye expressed with a general formula (1) used by this invention, a compound (a) thru/or a compound (k) are shown below.

a chain transfer agent, an antioxidant, thermal polymerization inhibitor, a leveling agent, etc. exposure may be 1% or more. Furthermore, various additive agents, for example, a plasticizer, prepare the concentration of cyanine dye (C) so that the transmissivity of the laser beam for an restriction in the compounding ratio of each above-mentioned ingredient, it is preferred to preferred that refractive index difference is 0.02 or more further. Although there is no specific or more ethylenic unsaturated bonds which can polymerize is 0.005 or more, and it is more refractive index difference with the refractive index of the compound (B) which has at least one monomer, or a copolymer of the vinyl monomer of two or more ingredients, It is preferred that The refractive index of the high molecular compound (A) which is a homopolymer of a vinyl obtained by the ability to apply it in the shape of a coat on substrates, such as a glass plate, dissolved into a suitable solvent by arbitrary concentration, and the obtained solution can be initiator which consists of cyanine dye (C) and a sulfonium organicity boron complex (D) is ethylenic unsaturated bonds which can polymerize, And although the photopolymerization vinyl monomer of two or more ingredients, The compound (B) which has at least one or more molecular compound (A) which is a homopolymer of a vinyl monomer, or a copolymer of the [0046] The photosensitive materials for hologram recording of use by this invention, The high

may be added if needed. [0047] Quantity occupied in all the photosensitive materials of a high molecular compound (A)

which is a homopolymer of a vinyl monomer or a copolymer of a vinyl monomer of two or more ingredients is 30 to 70 % of the weight preferably ten to 90% of the weight, in order to perform hologram recording which has high diffraction efficiency. The amount of compound (B) used which has at least one or more ethylenic unsaturated bonds which can polymerize, It is 40 - 150 weight section preferably ten to 200 weight section to high molecular compound (A) 100 weight section which is a homopolymer of a vinyl monomer or a copolymer of a vinyl monomer of two or more ingredients which is a base material. Since maintenance of high diffraction of two or more ingredients which is a base material. Since maintenance of high diffraction at two or more ingredients which is a base material. Since maintenance of high diffraction of two or more ingredients which is a base material. Since maintenance of high diffraction of two or more ingredients which is a base material. Since maintenance of high diffraction of two or more ingredients which is a base material. Since maintenance of high diffraction of two or more ingredients which is a base material.

a mentioned range, it is not desirable.

[0048]Cyanine dye (C) of a general formula (1) among photopolymerization initiators of use by this invention, it is preferably used in the range of 0.5 - 15 weight section 0.1 to 30 weight section in the family of a solution to high molecular compound (A) 100 weight section which is a homopolymer of a vinyl monomer of two or more ingredients. The amount used monomer, or a copolymer of a vinyl monomer of two or more ingredients. The amount used receives restriction with optical density of photosensitive layer thickness and this thickness. That is, it is preferred that optical density uses it in the range which does not exceed 2. A sulfonium organicity boron complex (D) is preferably used in the range of 1 - 15 weight section of 10.1 to 20 weight section which is a homopolymer of a vinyl monomer, or a copolymer of a vinyl monomer of two or more

light and (or) heat for fixing of an unexposed portion or a portion with few light exposures. [0051]A sensitive plate or a film by which hologram recording was carried out needs to apply performed. An example of an optical system is shown in drawing 1. laser, helium-Ne laser, Kr ion laser, and ruby laser, and volume phase type hologram record is influenced by vibration, it irradiates with visible light laser, such as helium-Cd laser, Ar ion materials produced by making it like, After fixing to an electrode holder so that it may not be ensitive plate or a film formed above with hologram recording photosensitive substrate and a film, a binder or a liquefied substance may be made to exist. order to improve airtightness between a protective layer and a film (and) or between a may carry out coating of the solution of said polymer. A glass plate may be pasted together. In polyvinyl chloride, a polyvinylidene chloride, polyvinyl alcohol, or polyethylene terephthalate, or protective layer may paste together a film or boards made from a plastic, such as polyolefine, or a bar coating machine. A protective layer for oxygen interception may be formed on it. A composition ratios in a suitable solvent for a spin coater, a roll coater, a knife coating machine, sensifizing solution made to dissolve hologram recording photosensitive materials of the above [0049]A film is formed on substrates, such as a direct glass plate and a plastic film, by using a .etneibergni

Visible light and (or) ultraviolet radiation, such as a carbon arc, a high-pressure mercury-vapor lamp, a xenon lamp, a metal halide lamp, a fluorescent lamp, a tungsten lamp, etc. besides

visible light laser, are used for light. As for heat, heating among 40 to 160 ** is preferred. Light and heat may be simultaneously applied to a sensitive plate or a film by which hologram recording was carried out, or light and heat may be applied independently. Operation of exfoliating a protective film before and after applying light and (or) heat may be performed. [Function]The high molecular compound (A) whose hologram recording material of use by this invention is a homopolymer of a vinyl monomer, or a copolymer of the vinyl monomer of two or more ingredients, The combination of the compound (B) and cyanine dye (C) which have at least one ethylenic unsaturated bond which can polymerize, and a sulfonium organicity boron complex (D) is included.

exposure, and the transparency of a hologram is made to improve by them after this. coloring component is effectively decolorized by down stream processing, especially optical and a hologram without aging is manufactured. The cyanine dye (C) which remained as a at this time, Crosslinking reaction arises between (A) and (B), it is still more chemically stable monomer of two or more ingredients has an acrylyl group (meta) which can construct a bridge compound (A) which is a homopolymer of a vinyl monomer or a copolymer of the vinyl and a hologram without aging is manufactured. In the case where the high molecular bonds in which the unreacted polymerization is possible is promoted, it is chemically stable the polymerization of the compound (B) which has at least one or more ethylenic unsaturated Furthermore, after hologram recording, by adding the tail end process by light and (or) heat, the volume phase type hologram with high diffraction efficiency was manufactured. interferential action of this laser beam and a weak part becomes large, and it is guessed that polymerize is 0.005 or more, the refractive index difference of the strong part of the compound (B) which has at least one or more ethylenic unsaturated bonds which can ingredients at this time, When refractive index difference with the refractive index of the homopolymer of a vinyl monomer, or a copolymer of the vinyl monomer of two or more hologram is recorded. The refractive index of the high molecular compound (A) which is a interferential action, as a result, among both parts, refractive index difference arises and a interferential action of this laser beam, density improves compared with the weak part of the strong part of the interferential action of this laser beam. Therefore, in the strong part of the interferential action in that case, and which can be polymerized spreads and polymerizes to ethylenic unsaturated bonds which can polymerize arises, which are in the weak part of where the polymerization reaction of the compound (B) which has at least one or more radiation part, The compound (B) which has at least one or more ethylenic unsaturated bonds with a laser beam in hologram recording I the strong part of this interferential action in a laser [0052]In [if the hologram recording material of this photopolymerization nature is irradiated

[Example] Based on an example, this invention is explained more to details below. In each

[0056]A sensitivity characteristic, diffraction efficiency, playback wavelength, and a Table 2. stability test result when it was operated by the same method as Example 3 were shown in sensitivity characteristic, diffraction efficiency, playback wavelength, and a preservation the sulfonium organicity boron complex (compound (m)) thru/or the compound (r), and also. A [0055]Replaced the sulfonium organicity boron complex (I) in 12 to example 17 Example 3 with were collectively shown in Table 1. efficiency, diffraction efficiency, playback wavelength, and a preservation stability test result diffraction efficiency. The exposure energy quantity which gives the maximum diffraction and a value when a sample is not placed but direct incident light is received was made into light from a sample was detected. The ratio of the biggest value except regular reflection light monochromatic light was entered into the sample at the angle of 45 degrees, and the diffracted on the circumference with a radius [centering on a sample] of 20 cm. 0.3-mm-wide type spectrophotometer. This device can install a photograph multimeter with a 3-mm-wide slit O654)Diffraction efficiency was measured with the product ARTmade from Jasco Industry200 hologram exposure, and it set in 120 ** oven after that for 1 hour. exposure, one side of 2 light flux was intercepted and it exposed to the same exposure time as Examples 7 and 9 using the 633-nm light of helium-Ne laser. After carrying out hologram 676-nm light of Kr ion laser was used in Example 10 using the 647-nm light of Kr ion laser in Examples 2, 4, and 5, the 514-nm light of Ar ion laser is used, in Examples 6, 8, and 11, the drawing 1. In Examples 1 and 3, the 488-nm light of Ar ion laser is used in that case, In performed to this sensitive plate using the optical system for hologram creation shown in alcohol was applied by a 3-mil applicator. Hologram exposure by two beam interference was sensitive plate for hologram recording was created. The 5-% of the weight solution of polyvinyl the thickness after sensitizing solution desiccation might be set to 10 micrometers, and the sulfonium organicity boron complex (compound (I)) was applied using a 3-mil applicator so that sensitizing solution which consists five copies and tetrachloroethane of 900 copies in a in phenoxy ethyl acrylate (POEA) Three copies, On a 100x125x3-mm glass plate, the (compound (a)) thru/or the compound (k) expressed with 90 copies and a general formula (1) Example 1 - 11 poly methyl methacrylate (PMMA) 100 weight sections, The cyanine dye following example, especially, a part expresses a weight section, as long as there is no notice.

[0056]A sensitivity characteristic, diffraction efficiency, playback wavelength, and a preservation stability test result when the monomer in example 18 Example 3 which can be polymerized was changed to tetrabromobisphenol A ethylene oxide denaturation dimethacrylate and also it was operated by the same method as Example 3 were shown in Table 3.

[0057]A sensitivity characteristic, diffraction efficiency, playback wavelength, and a preservation stability test result when the monomer in example 19 Example 3 which can be

polymerized was changed to N-vinylcarbazole and also it was operated by the same method as Example 3 were shown in Table 3.
